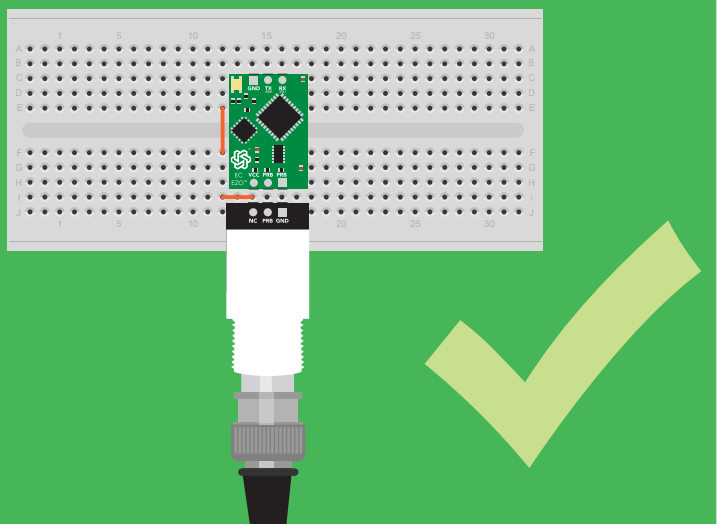
STOP

SOLDERING THIS DEVICE VOIDS YOUR WARRANTY.

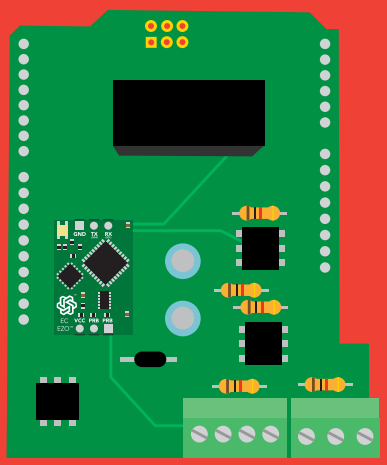
This is sensitive electronic equipment. Get this device working in a solderless breadboard first. Once this device has been soldered it is no longer covered by our warranty.

This device has been designed to be soldered and can be soldered at any time. Once that decision has been made, Atlas Scientific no longer assumes responsibility for the device's continued operation. The embedded systems engineer is now the responsible party.

Get this device working in a solderless breadboard first!



Do not embed this device without testing it in a solderless breadboard!



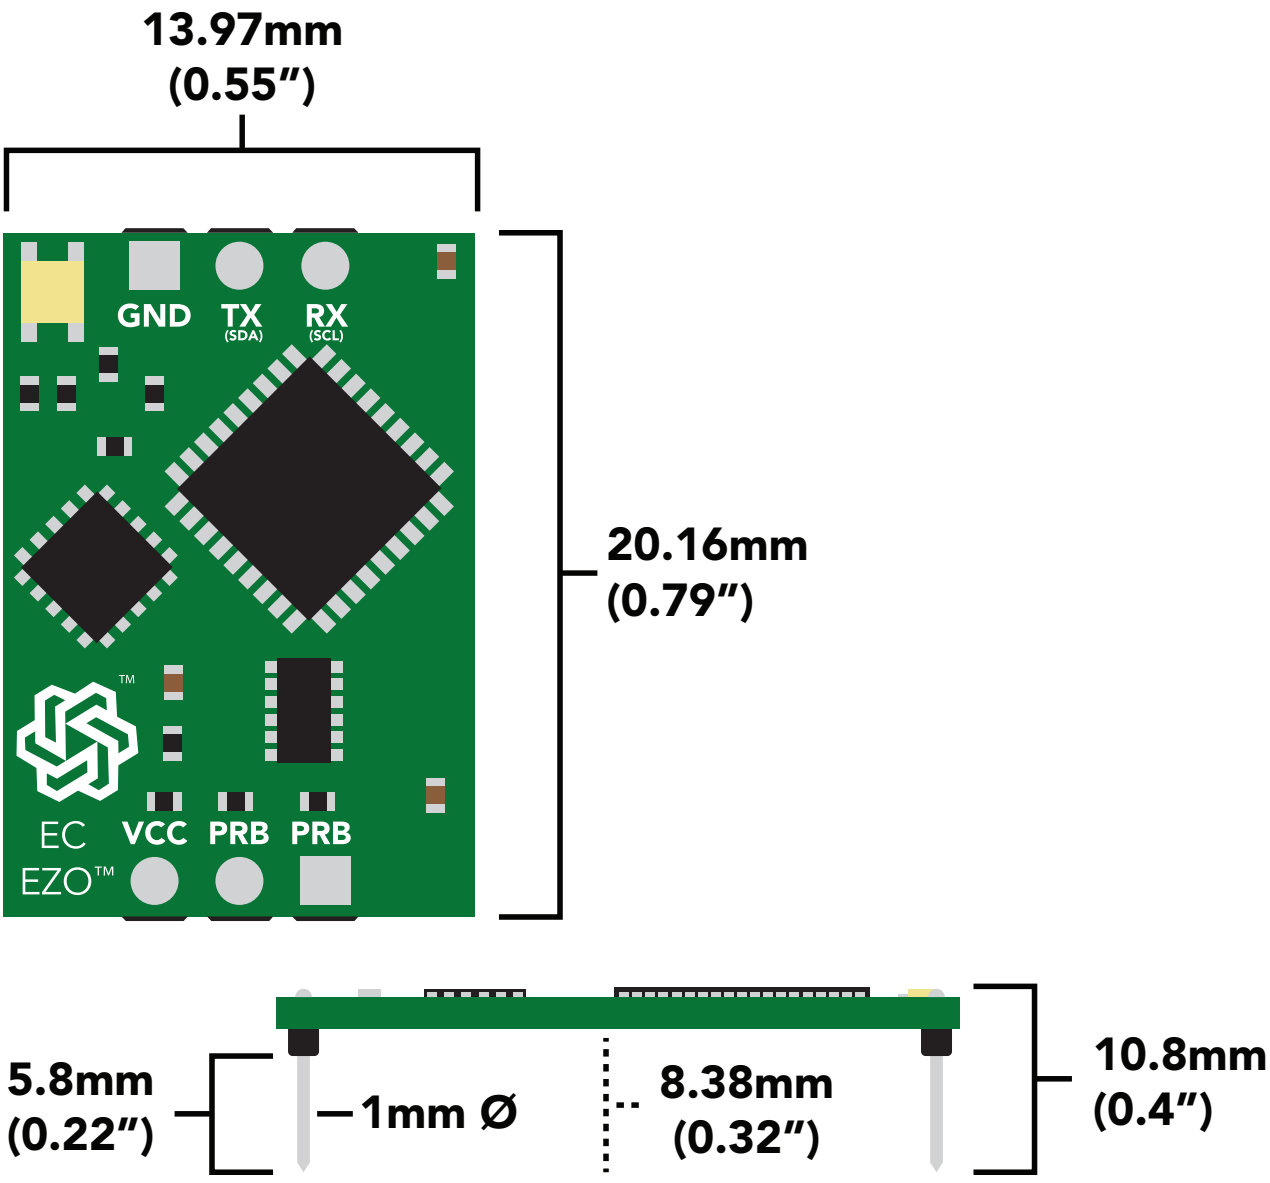
r 0.1

Table of contents

UART

I²C

EZO™ circuit dimensions



Power consumption

	LED	MAX	STANDBY	SLEEP
5V	ON	50 mA	18.14 mA	0.7 mA
	OFF	45 mA	15.64 mA	
3.3V	ON	35 mA	16.85 mA	0.4 mA
	OFF	34 mA	15.85 mA	

Absolute max ratings

Parameter	MIN	TYP	MAX
Storage temperature (EZO™ Conductivity)	-60 °C		150 °C
Operational temperature (EZO™ Conductivity)	-40 °C	25 °C	125 °C
VCC	3.3V	5V	5.5V

Conductivity probe range

The EZO™ Conductivity circuit is capable of connecting to any two-conductor conductivity probe, ranging from:

K 0.01 → **K 10**

Atlas Scientific™ has tested three different K value probe types:

K 0.1

accurate reading range

0.07µS/cm – 50,000µS/cm

TDS *(ppm)* 0 – 25,000

Salinity *(ppt)* 0 – 33

K 1.0

accurate reading range

5µS/cm – 200,000+µS/cm

TDS *(ppm)* 2 – 100,000

Salinity *(ppt)* 0 – 42*

***salinity scale cannot go any higher**

K 10

accurate reading range

10µS/cm – 1S/cm

TDS *(ppm)* 5 – 500,000

Salinity *(ppt)* 0 – 42*

***salinity scale cannot go any higher**

Atlas Scientific™ does not know what the accurate reading range would be for conductivity probes, other than the above mentioned values. Determining the accurate reading range of such probes, i.e. **K 2.6**, or **K 0.66**, is the responsibility of the embedded systems engineer.

AtlasScientific™ Environmental Robotics

Resolution

The EZO™ Conductivity circuit, employs a method of scaling resolution. As the conductivity increases the resolution between readings decreases.

The EZO™ Conductivity circuit will output conductivity readings where the first **4 digits** are valid and the others are set to 0. This excludes conductivity readings that are less than 9.99. In that case, only 3 conductivity digits will be output.

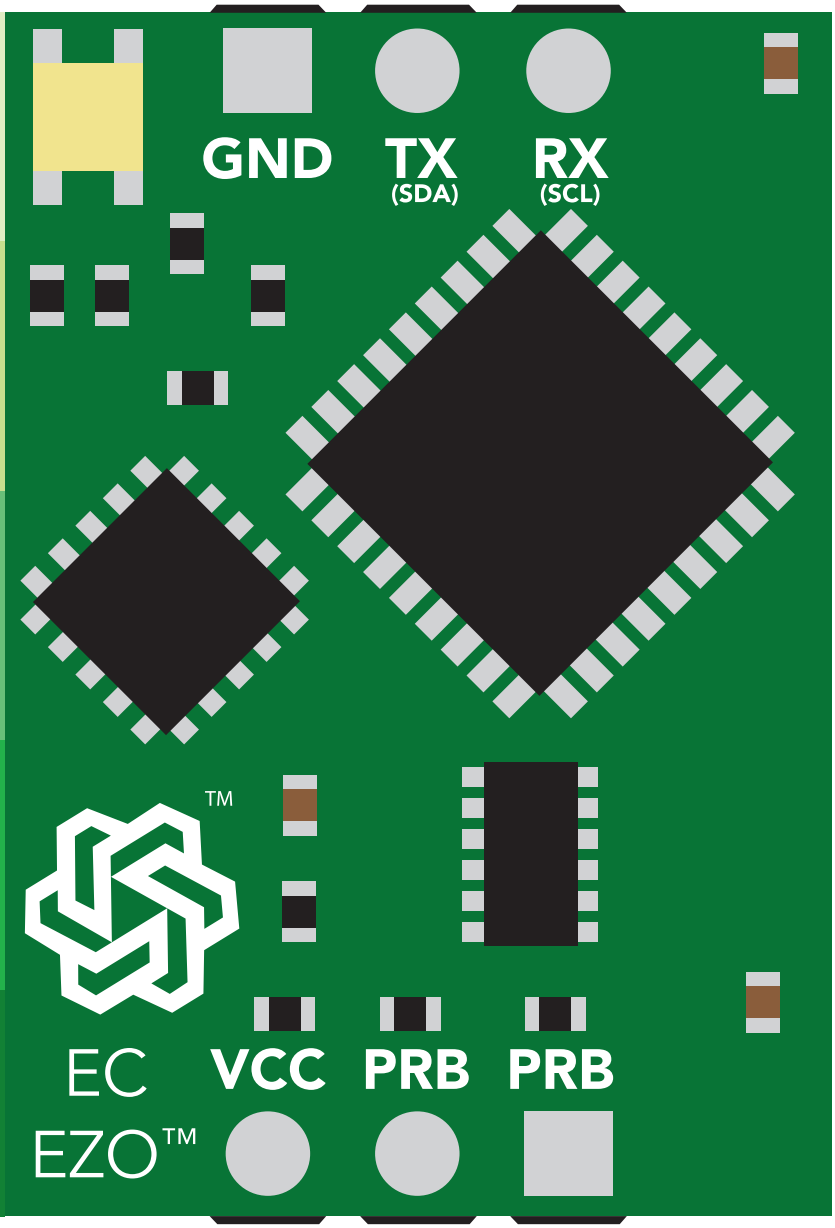
0.07 – 99.99
Resolution = **0.01µS/cm**

100.1 – 999.9
Resolution = **0.1µS/cm**

1,000 – 9,999
Resolution = **1.0µS/cm**

10,000 – 99,990
Resolution = **10µS/cm**

100,000 – 999,900
Resolution = **100µS/cm**



Operating principle

An E.C. ***(electrical conductivity)*** probe measures the electrical conductivity in a solution. It is commonly used in hydroponics, aquaculture and freshwater systems to monitor the amount of nutrients, salts or impurities in the water.

Inside the conductivity probe, two electrodes are positioned opposite from each other, an AC voltage is applied to the electrodes causing cations to move to the negatively charged electrode, while the anions move to the positively electrode. The more free electrolyte the liquid contains, the higher the electrical conductivity.

AtlasScientific™
Environmental Robotics

Output units

By default, EZO™ Conductivity circuits with firmware version 2.10 and above will *only* output EC. To enable these parameters see page 35 for UART, and 62 for I²C.

The EZO™ Conductivity circuit also has the capability to read:

Conductivity = µS/cm
Total dissolved solids = ppm
Salinity = PSU (ppt) 0.00 – 42.00
Specific gravity (sea water only) = 1.00 – 1.300

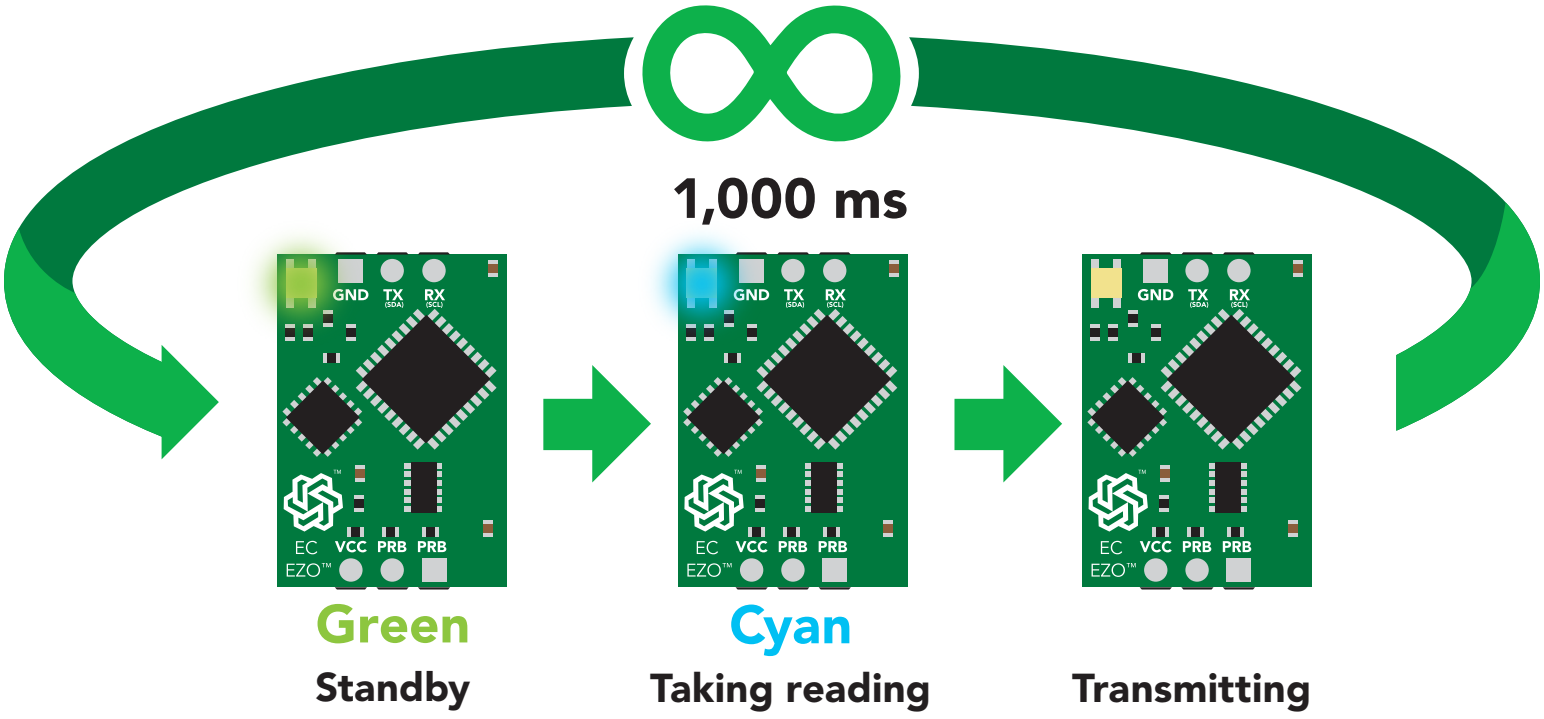
These parameters must be individually enabled within the device. See page **35** to enable each parameter in UART mode, and on page **62** for I²C mode.

Once these parameters have been enabled, output will be a CSV string.

Example
EC,TDS,SAL,SG

Default LED blink pattern

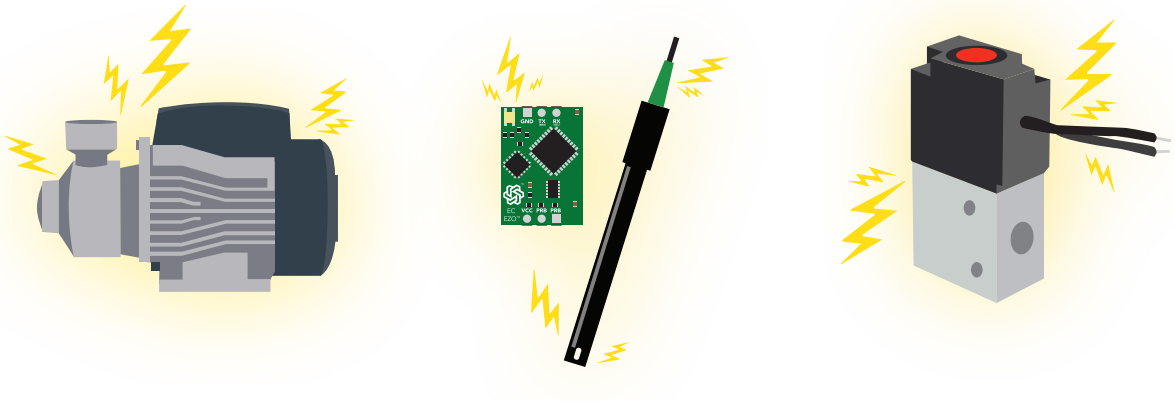
This is the LED pattern for Continous Mode *(default state)*
This can only happen when the device is in **UART** mode.



Power and data isolation

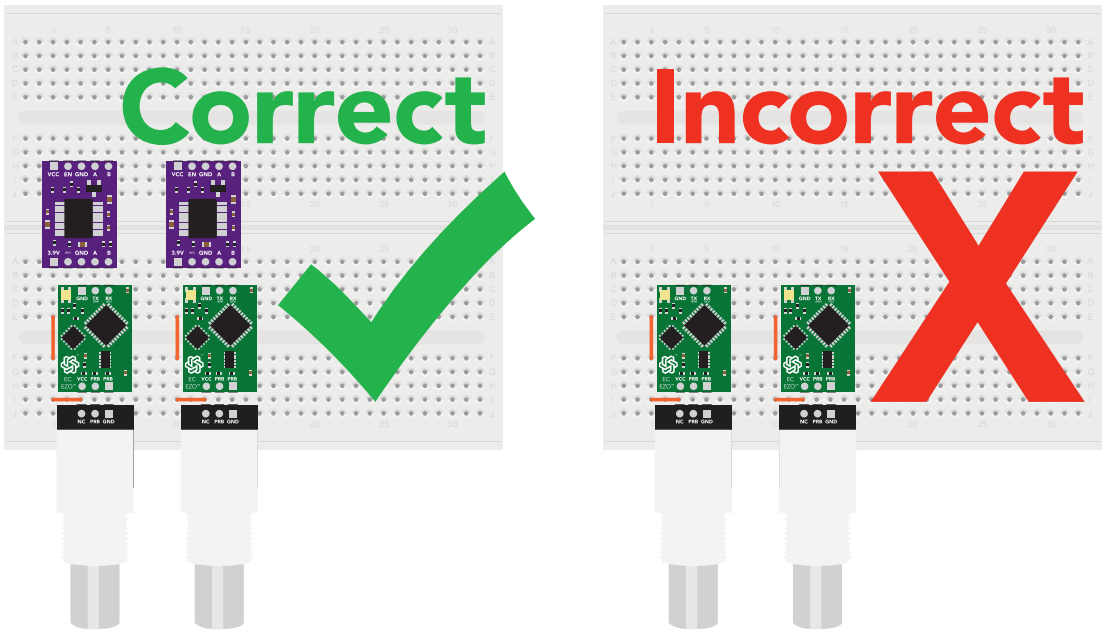
The Atlas Scientific EZO™ Conductivity circuit is a very sensitive device. This sensitivity is what gives the Conductivity circuit its accuracy. This also means that the Conductivity circuit is capable of reading micro-voltages that are bleeding into the water from unnatural sources such as pumps, solenoid valves or other probes/sensors.

When electrical noise is interfering with the Conductivity readings it is common to see rapidly fluctuating readings or readings that are consistently off. To verify that electrical noise is causing inaccurate readings, place the Conductivity probe in a cup of water by itself. The readings should stabilize quickly, confirming that electrical noise was the issue.



When reading from two EZO™ Conductivity circuits, it is ***strongly recommended*** that they are electrically isolated from each other.

Basic EZO™ Inline Voltage Isolator



Without isolation, Conductivity readings will effect each other.

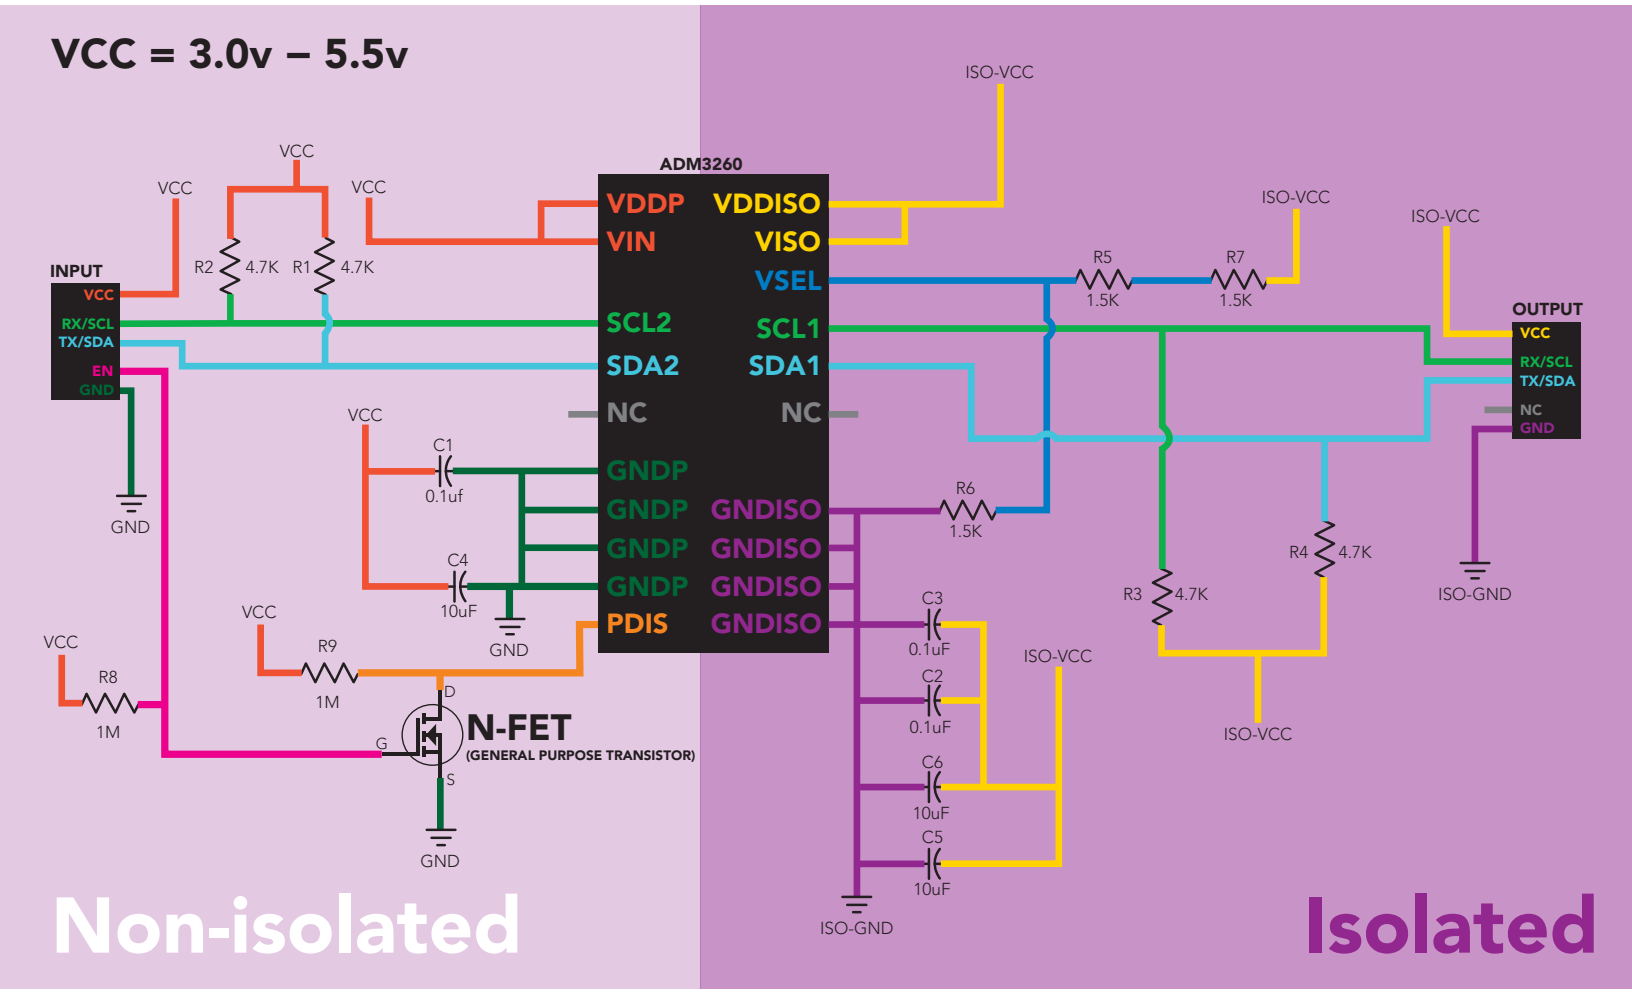
AtlasScientific™ Environmental Robotics

r 0.1

This schematic shows exactly how we isolate data and power using the and a few passive components. The ADM3260 can output isolated power up to 150 mW and incorporates two bidirectional data channels.

This technology works by using tiny transformers to induce the voltage across an air gap. PCB layout requires special attention for EMI/EMC and RF Control, having proper ground planes and keeping the capacitors as close to the chip as possible are crucial for proper performance. The two data channels have a 4.7kΩ pull up resistor on both the isolated and non-isolated lines (R1, R2, R3, and R4) The output voltage is set using a voltage divider (R5, R6, and R7) this produces a voltage of 3.9V regardless of your input voltage.

Isolated ground is different from non-isolated ground, these two lines should not be connected together.

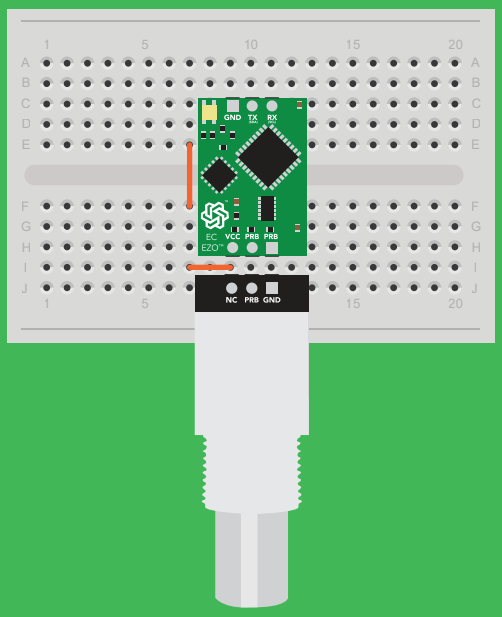


✓ Correct wiring

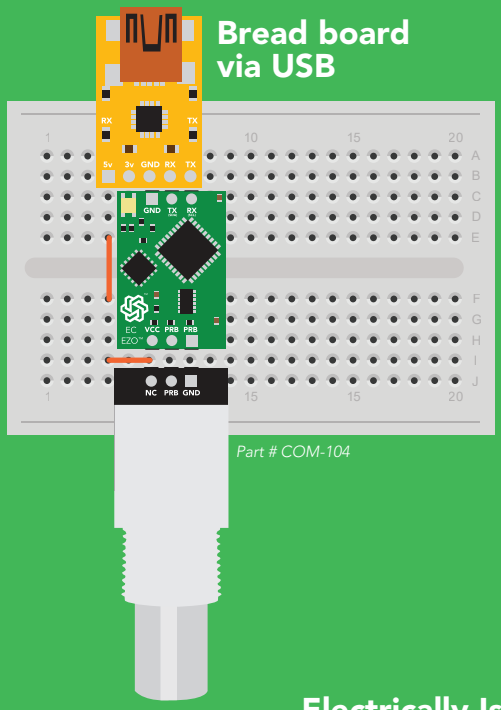
Carrier board

USB carrier board

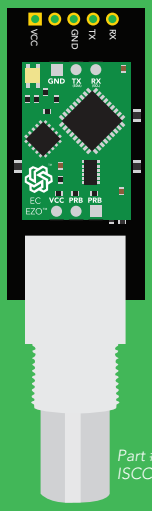
Bread board



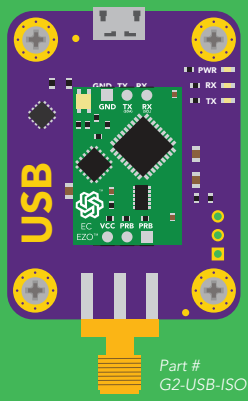
Bread board via USB



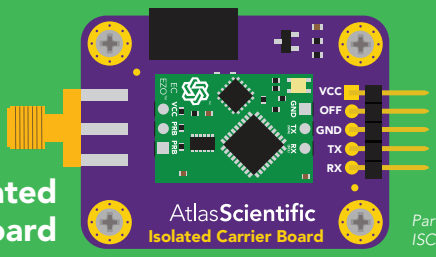
Part # COM-104



Part # ISCCB



Part # G2-USB-ISO

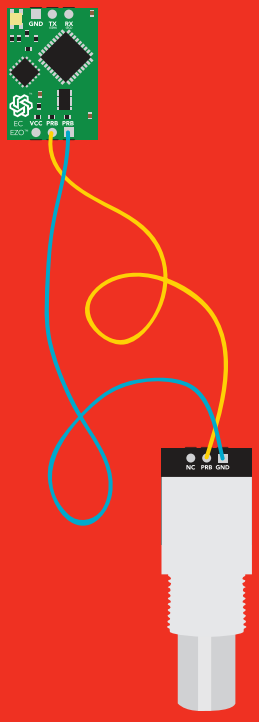


Part # ISCCB-2

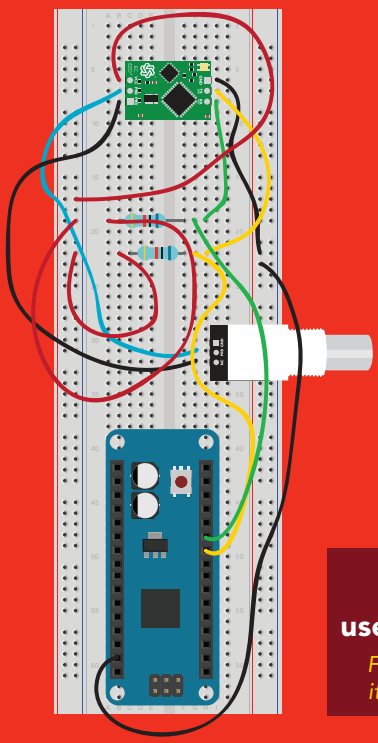
Electrically Isolated EZO™ Carrier Board

X Incorrect wiring

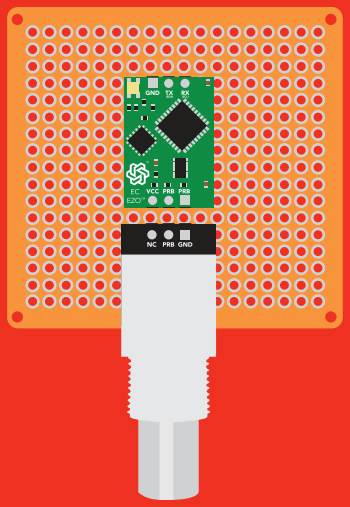
Extended leads



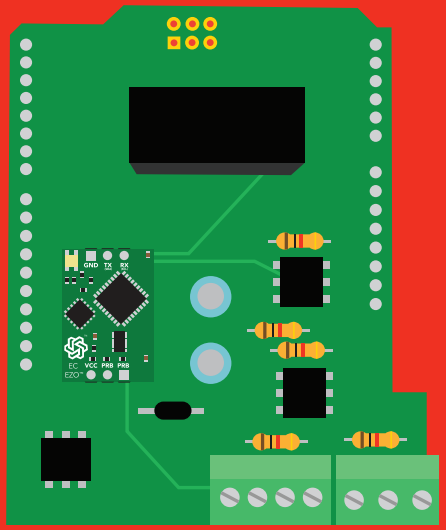
Sloppy setup



Perfboards or Protoboards



*Embedded into your device



NEVER
use Perfboards or Protoboards
Flux residue and shorting wires make it very hard to get accurate readings.

Calibration theory

Simple calibration

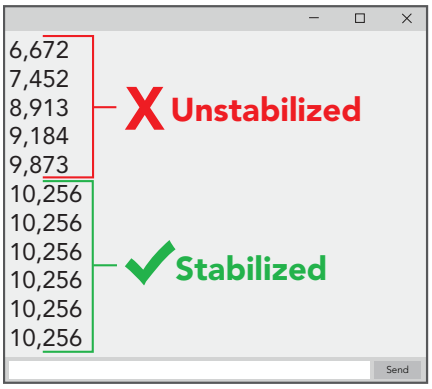
UART mode

Continuous readings

Advanced calibration

I²C mode

Continuously request readings



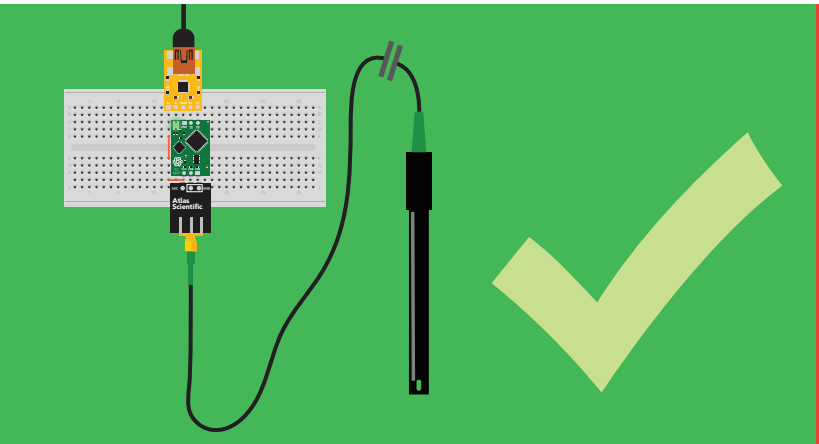
The most important part of calibration is watching the readings during the calibration process.

It's easiest to calibrate the device in its default state (UART mode, with continuous readings enabled).

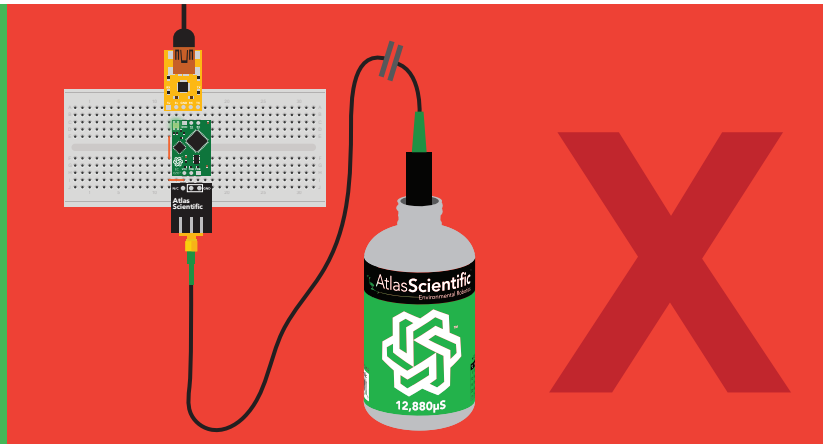
Switching the device to I²C mode after calibration ***will not*** affect the stored calibration. If the device must be calibrated in I²C mode be sure to ***continuously request readings*** so you can see the output from the probe.

1. Pre-calibration setup

Connect the dry conductivity probe and take continous readings.



A simple hardware configuration with dry probe.



Not yet! Do not put the probe into calibration solution.

2. Set probe type

If your probe ≠ K 1.0 *(default)*, then set the probe type by using the **"K,n"** command. *(where n = K value of your probe)* for more information, see page **33** or **60**.

3. Dry calibration

Perform a dry calibration using the command **"Cal,dry"** Even though you may see reading of 0.00 before issuing the **"Cal,dry"** command, it is still a necessary part of calibration.

00.00 → "Cal,dry" → 0.00 ✔ Correct

17.00 → "Cal,dry" → 0.00 ✔ Also correct

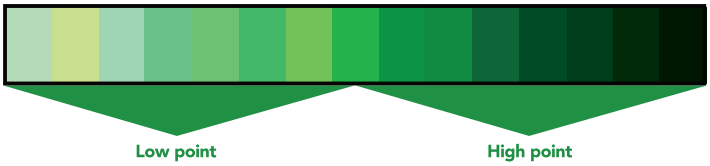
4. Single point or Two point calibration

No calibration

Single point calibration

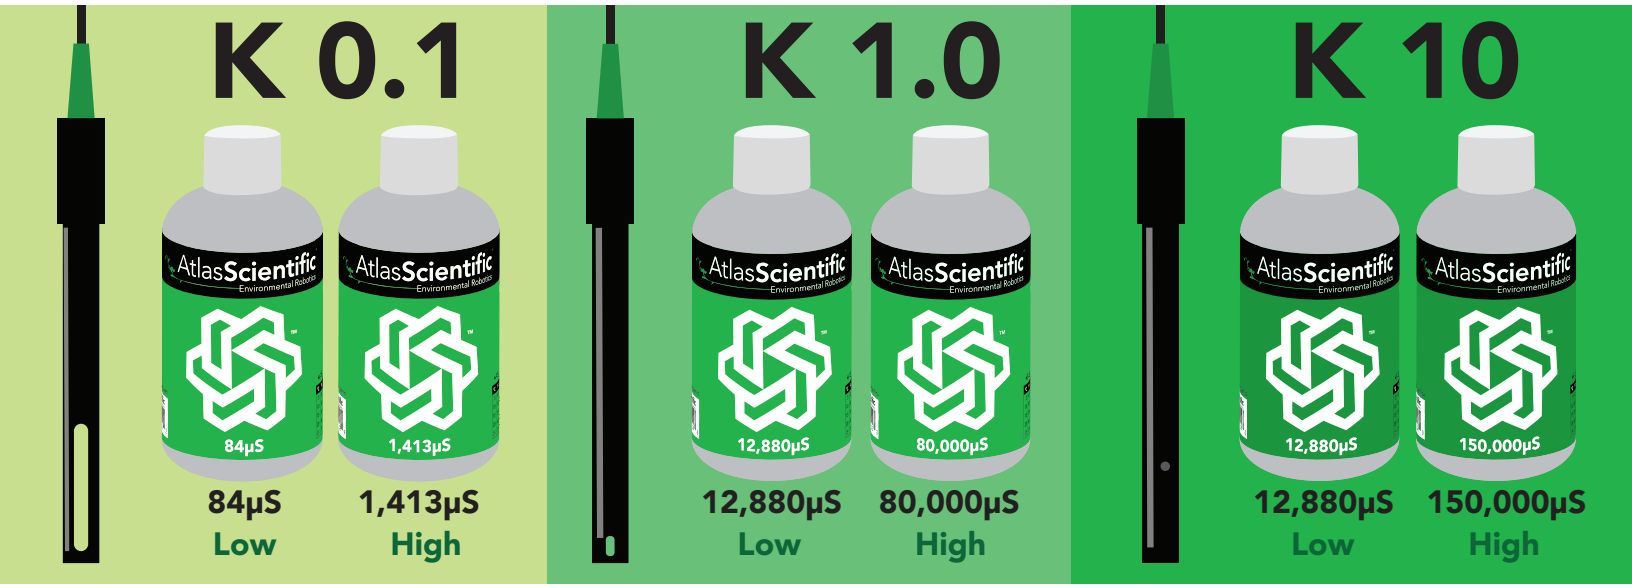
Narrow range of accuracy

Two point calibration



Wide range of accuracy

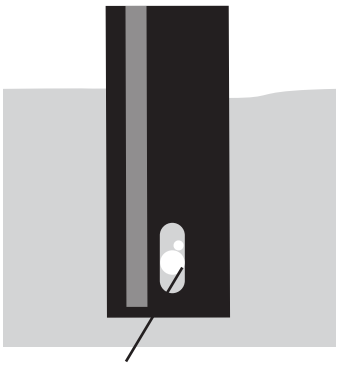
Recommended calibration points



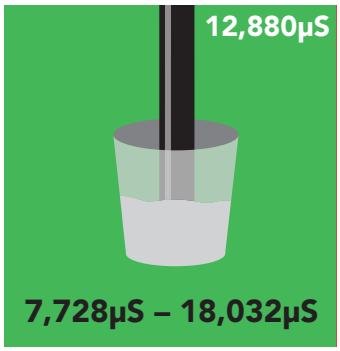
When calibrating, Atlas Scientific recommends using the above µS values. However, you can use any µS values you want.

Two point calibration - low point

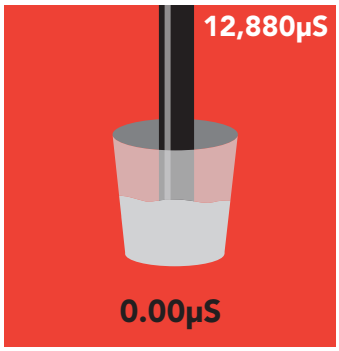
Pour a small amount of the low point calibration solution into a cup. Shake the probe to make sure you do not have trapped air bubbles in the sensing area. You should see readings that are off by **1 – 40%** from the stated value of the calibration solution. Wait for readings to stabilize *(small movement from one reading to the next is normal).*



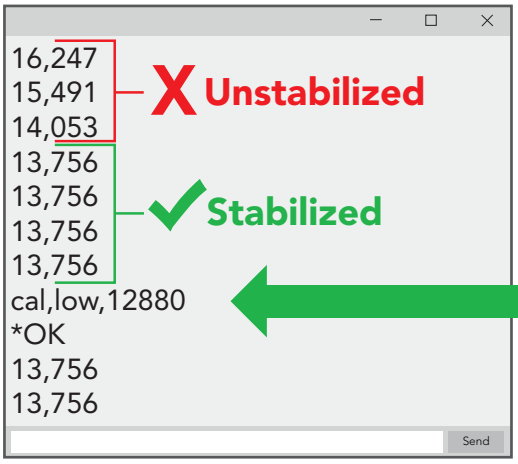
Trapped air in sensing area (shake to remove)



+/– 40%



check probe connection, you cannot calibrate to 0.



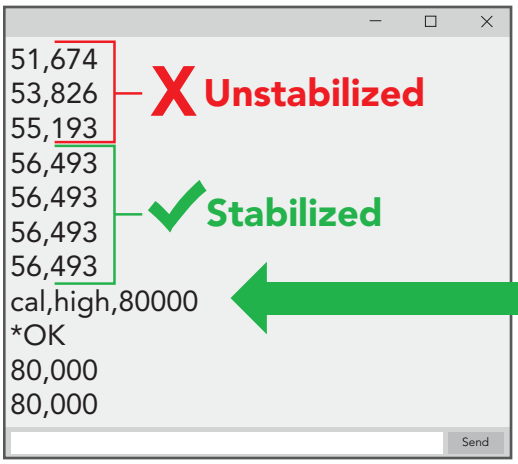
X Unstabilized

✓ Stabilized

Once the readings stabilize, issue the low point calibration command.**"cal,low,12880"** *(Readings will **NOT** change)*

Two point calibration - high point

- Rinse off the probe before calibrating to the high point.
- Pour a small amount of the high point calibration solution into a cup.
- Shake the probe to remove trapped air.
- Readings may be off by +/- 40%
- Wait for readings to stabilize.



X Unstabilized

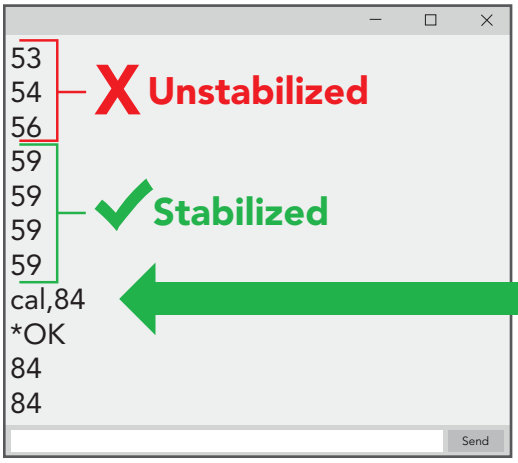
✓ Stabilized

Once the readings stabilize, issue the high point calibration command.**"cal,high,80000"** *(Readings **will** change, calibration complete).*

AtlasScientific™ Environmental Robotics

Single point calibration

- Pour a small amount of calibration solution into a cup *(µS value of your choice)*.
- Shake the probe to remove trapped air.
- Readings may be off by +/- 40%
- Wait for readings to stabilize.

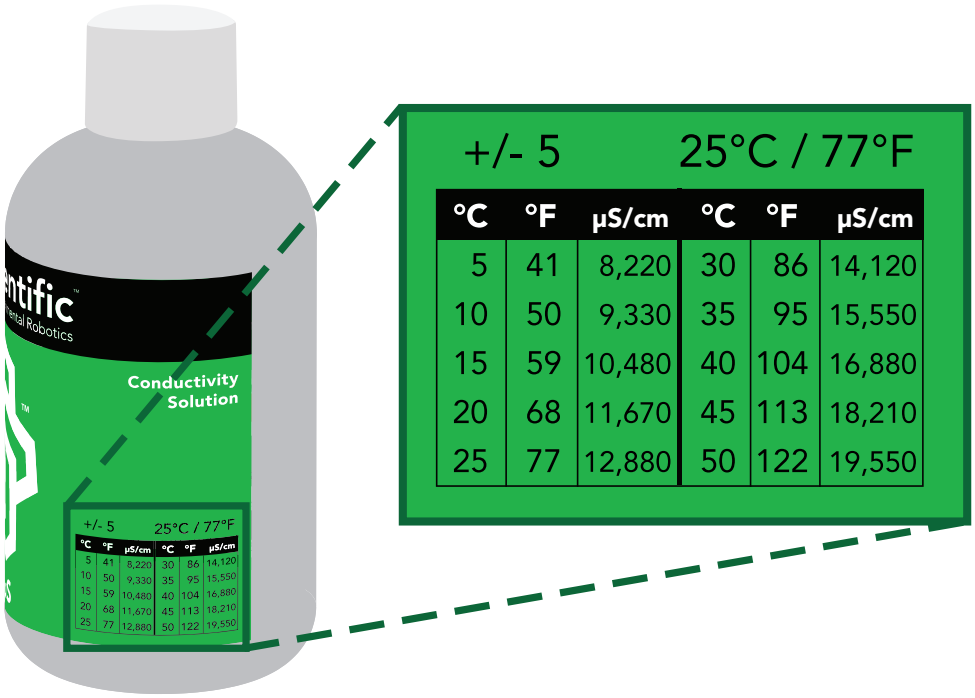


Once the readings stabilize, issue the single point calibration command.**"cal,n"** where n = any value. *(Readings **will** change, calibration complete).*

Temperature compensation during calibration

Temperature has a significant effect on conductivity readings. The EZO™ Conductivity circuit has its temperature compensation set to 25˚ C as the default. ***At no point should you change the default temperature compensation during calibration.***

If the solution is +/- 5˚ C *(or more)*, refer to the chart on the bottle, and calibrate to that value.



+/- 5 25°C / 77°F

°C	°F	µS/cm	°C	°F	µS/cm
5	41	8,220	30	86	14,120
10	50	9,330	35	95	15,550
15	59	10,480	40	104	16,880
20	68	11,670	45	113	18,210
25	77	12,880	50	122	19,550

Temperature compensation example

For this example, we brought the temperature of the solution down to 10˚ C.
Referring to chart on the bottle, you can see the value you should calibrate to is **9,330µS**.

+/- 5 25°C / 77°F

°C	°F	µS/cm	°C	°F	µS/cm
5	41	8,220	30	86	14,120
10	50	9,330	35	95	15,550
15	59	10,480	40	104	16,880
20	68	11,670	45	113	18,210
25	77	12,880	50	122	19,550

Over time, the readings will normalize as the solution warms to 25˚ C.

See pages **34** or **61** for more information.

Step 2. "cal,n"
Calibration complete!

Two point calibration:
Step 1 "cal,dry"
Step 2 "cal,low,n"
Step 3 "cal,high.n"
Calibration complete!

Atlas Scientific™ Environmental Robotics

Changing the TDS (ppm) conversion factor

There are several different conversion factors used to read TDS(ppm). For some applications, it may be necessary to use a conversion factor other than the default value of 0.54

Command syntax

TDS,n	<cr>	set custom conversion factor, n = any value between 0.01 – 1.00
TDS,?	<cr>	conversion factor being used

Example	Response
TDS,? <cr>	?TDS,0.54 <cr> *OK <cr>
R <cr>	EC TDS 100,54 <cr> *OK <cr>
TDS,0.46 <cr>	*OK <cr>
R <cr>	EC TDS 100,460 <cr> *OK <cr>

Common conversion factors

NaCl	0.47 – 0.50
KCL	0.50 - 0.57
"442"	0.65 – 0.85

Formula

EC x conversion factor = TDS

r 0.1

I²C mode

The I²C protocol is *considerably more complex* than the UART (RS–232) protocol. Atlas Scientific assumes the embedded systems engineer understands this protocol.

To set your EZO™ device into I²C mode click here

Settings that are retained if power is cut

Calibration
Change I²C address

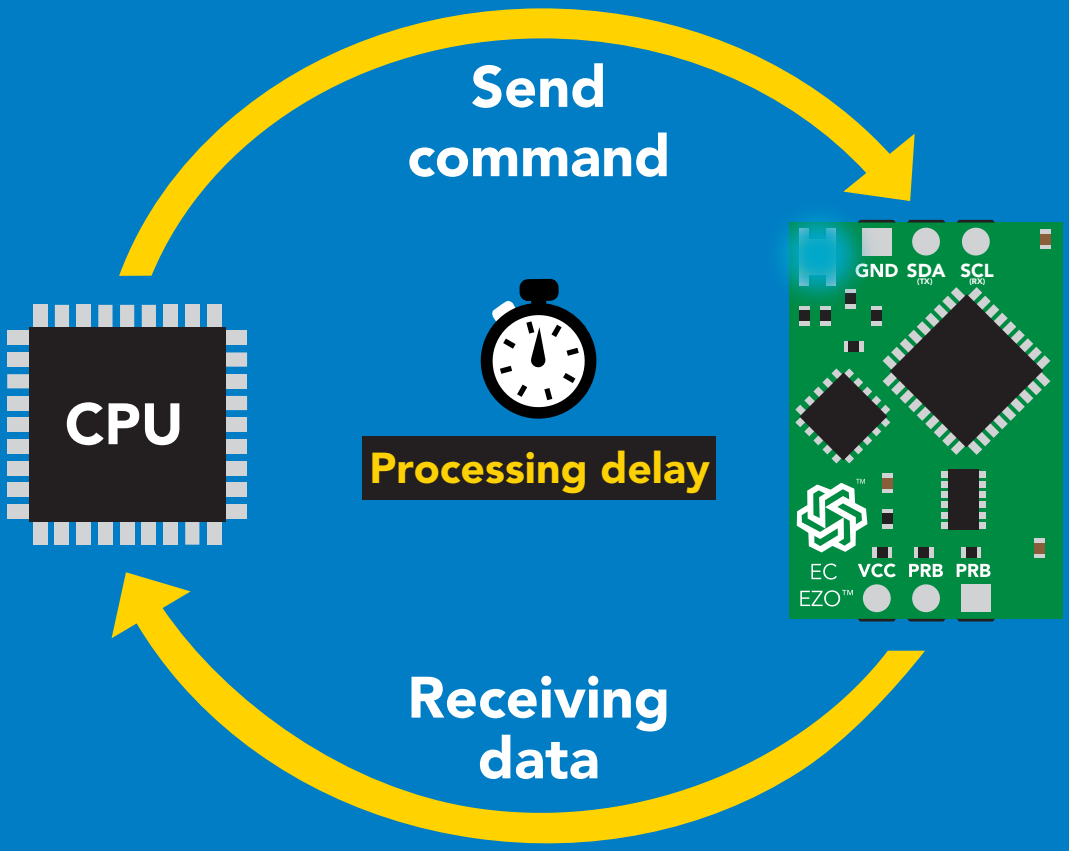
Response codes

After a command has been issued, a 1 byte response code can be read in order to confirm that the command was processed successfully.

Reading back the response code is completely optional, and is not required for normal operation.



Example

```
I2C_start;
I2C_address;
I2C_write(EZO_command);
I2C_stop;

delay(300);
```

Processing delay

```
I2C_start;
I2C_address;
Char[ ] = I2C_read;
I2C_stop;
```

The response code will always be 254, if you do not wait for the processing delay.

Response codes

Single byte, not string

255	no data to send
254	still processing, not ready
2	syntax error
1	successful request

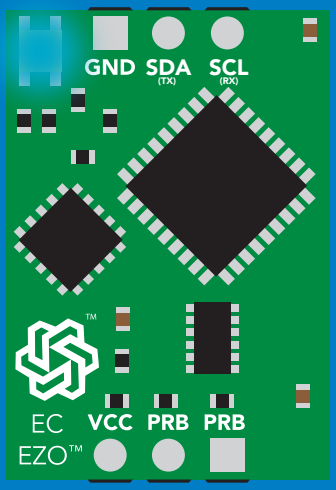
LED control

Command syntax

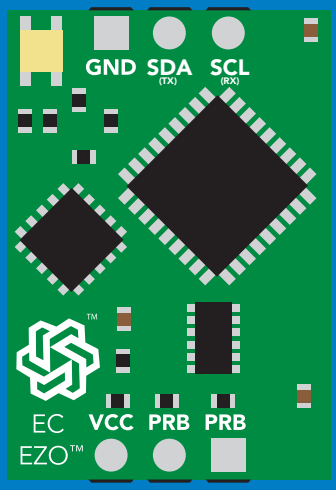
300ms processing delay

L,1	LED on	default
L,0	LED off	
L,?	LED state on/off?	

Example	Response
L,1	Wait 300ms — 1 Dec, 0 Null
L,0	Wait 300ms — 1 Dec, 0 Null
L,?	Wait 300ms — 1 Dec, ?L,1 ASCII, 0 Null **or** 1 Dec, ?L,0 ASCII, 0 Null



L,1



L,0

AtlasScientific™ Environmental Robotics

r 0.1

Find

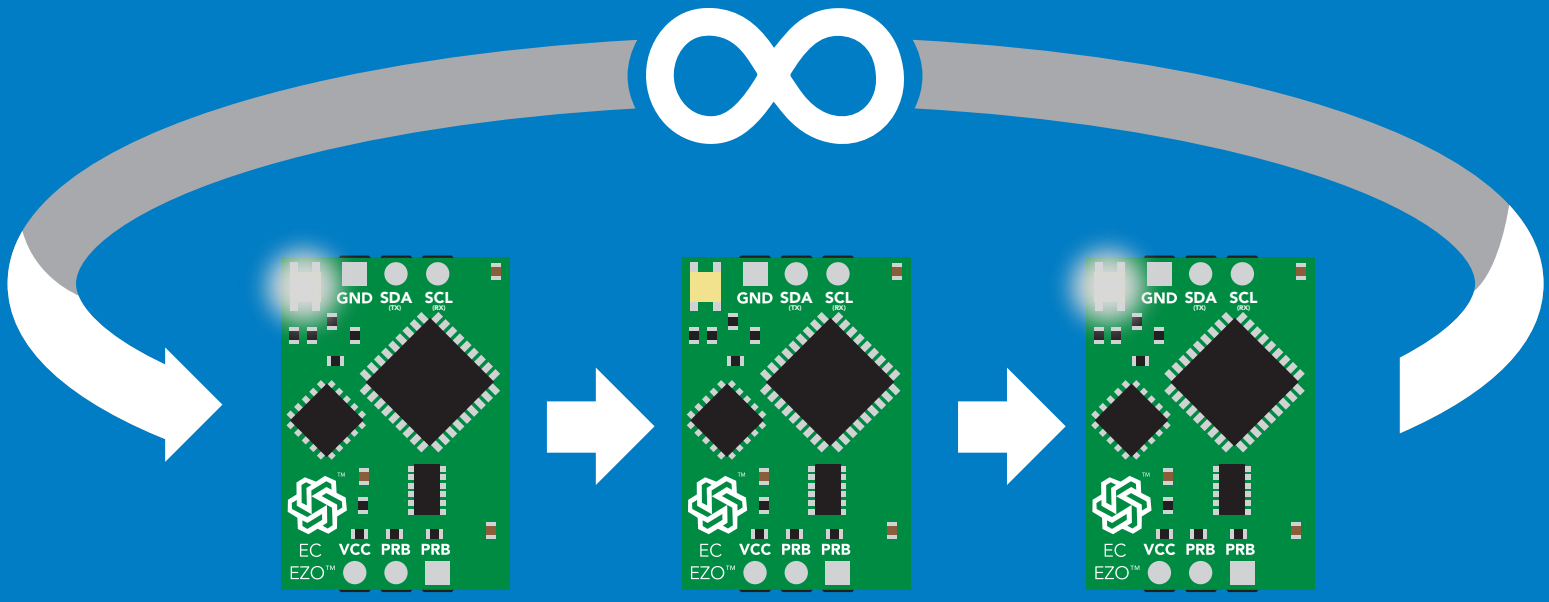
300ms processing delay

Command syntax

This command will disable continuous mode
Send any character or command to terminate find.

Find	LED rapidly blinks white, used to help find device

Example	Response
Find	Wait 300ms 1 Dec 0 Null



Atlas Scientific™ Environmental Robotics

r 0.1

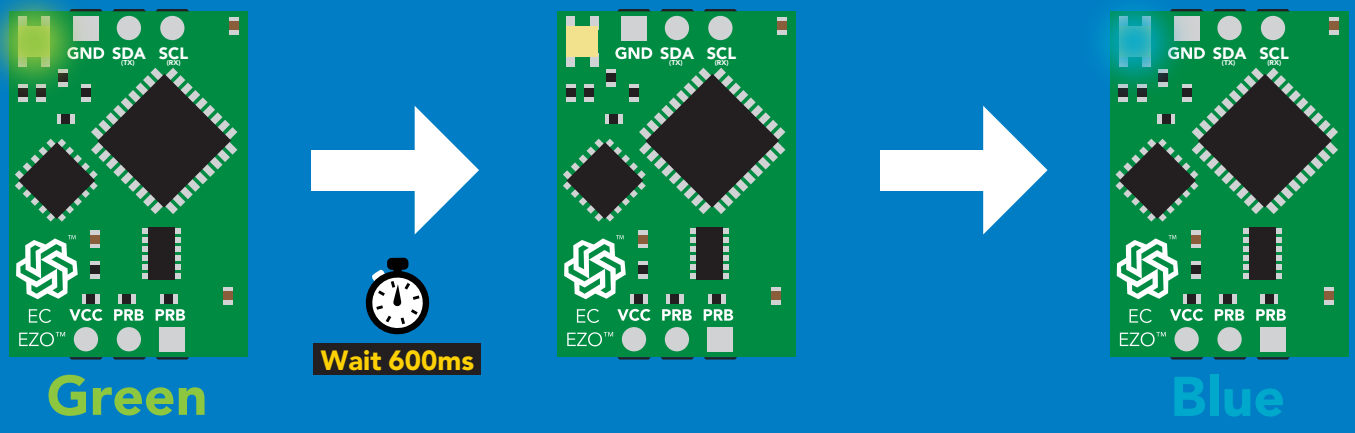
Taking reading

Command syntax

600ms processing delay

R return 1 reading

Example	Response
R	Wait 600ms 1 Dec 1,413 ASCII 0 Null



Calibration

600ms processing delay

Command syntax

Dry calibration must always be done first!

Cal,dry	dry calibration
Cal,n	single point calibration, where n = any value
Cal,low,n	low end calibration, where n = any value
Cal,high,n	high end calibration, where n = any value
Cal,clear	delete calibration data
Cal,?	device calibrated?

Example	Response
Cal,dry	Wait 600ms → 1 (Dec) 0 (Null)
Cal,84	Wait 600ms → 1 (Dec) 0 (Null)
Cal,low,12880	Wait 600ms → 1 (Dec) 0 (Null)
Cal,high,80000	Wait 600ms → 1 (Dec) 0 (Null)
Cal,clear	Wait 300ms → 1 (Dec) 0 (Null)
Cal,?	Wait 300ms → 1 (Dec) ?CAL,0 (ASCII) 0 (Null) or 1 (Dec) ?CAL,1 (ASCII one point) 0 (Null) or 1 (Dec) ?CAL,2 (ASCII two point) 0 (Null)

One point calibration:
Step 1. "cal,dry"
Step 2. "cal,n"
Calibration complete!

Two point calibration:
Step 1 "cal,dry"
Step 2 "cal,low,n"
Step 3 "cal,high,n"
Calibration complete!

Atlas Scientific Environmental Robotics

Changing the TDS (ppm) conversion factor

300ms processing delay

There are several different conversion factors used to read TDS(ppm). For some applications, it may be necessary to use a conversion factor other than the default value of 0.54

Command syntax

TDS,n	set custom conversion factor, n = any value between 0.01 – 1.00
TDS,?	conversion factor being used

Example Response

TDS,?

Wait 300ms

1	?TDS,0.54	0
Dec	ASCII	Null

R

Wait 300ms

	EC	TDS		
1	100,54			0
Dec	ASCII			Null

TDS,0.46

Wait 300ms

1	0
Dec	Null

R

Wait 300ms

	EC	TDS		
1	100,460			0
Dec	ASCII			Null

Common conversion factors

NaCl	0.47 – 0.50
KCL	0.50 - 0.57
"442"	0.65 – 0.85

Formula

EC x conversion factor = TDS

Atlas Scientific Environmental Robotics

Export calibration

300ms processing delay

Command syntax

Setting the probe type

Command syntax

300ms processing delay

K,n n = any value; floating point in ASCII

K,? probe K value?

K 1.0 is the default value

Example	Response
K,10	Wait 300ms — 1 (Dec) 0 (Null)
K,?	Wait 600ms — 1 (Dec) K,10 (ASCII) 0 (Null)

K 0.1

K 1.0

K 10

Atlas Scientific Environmental Robotics

Temperature compensation

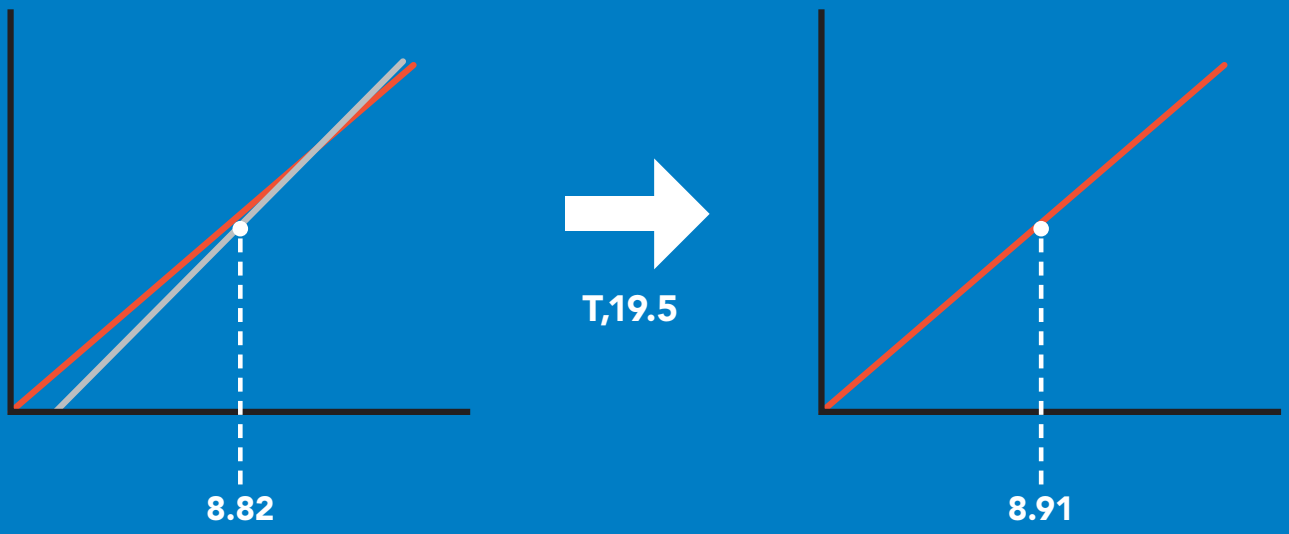
Command syntax

Default temperature = 25°C
Temperature is always in Celsius
Temperature is not retained if power is cut

T,n	n = any value; floating point or int	300ms processing delay
T,?	compensated temperature value?	
RT,n	set temperature compensation and take a reading*	

* This is a new command for firmware V2.13

Example	Response
T,19.5	Wait 300ms → 1 (Dec) 0 (Null)
RT,19.5	Wait 900ms → 1 (Dec) 8.91 (ASCII) 0 (Null)
T,?	Wait 300ms → 1 (Dec) ?T,19.5 (ASCII) 0 (Null)



AtlasScientific™
Environmental Robotics
r 0.2

Enable/disable parameters from output string

Command syntax

300ms processing delay

O, [parameter],[1,0]	enable or disable output parameter
O,?	enabled parameter?

Example	Response
O,EC,1 / O,EC,0	Wait 300ms · 1 Dec · 0 Null — enable / disable conductivity
O,TDS,1 / O,TDS,0	Wait 300ms · 1 Dec · 0 Null — enable / disable total dissolved solids
O,S,1 / O,S,0	Wait 300ms · 1 Dec · 0 Null — enable / disable salinity
O,SG,1 / O,SG,0	Wait 300ms · 1 Dec · 0 Null — enable / disable specific gravity
O,?	Wait 300ms · 1 Dec · ?,O,EC,TDS,S,SG ASCII · 0 Null — if all are enabled

Parameters

EC	conductivity
TDS	total dissolved solids
S	salinity
SG	specific gravity

Followed by 1 or 0

1	enabled
0	disabled

* If you disable all possible data types your readings will display "no output".

Atlas Scientific Environmental Robotics

Naming device

300ms processing delay

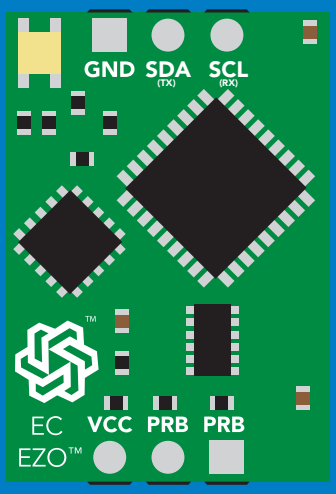
Command syntax

Do not use spaces in the name

Name,n	set name	n = _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ (1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16)
Name,?	show name	Up to 16 ASCII characters

Example	Response
Name,zzt	Wait 300ms → 1 (Dec) 0 (Null)
Name,?	Wait 300ms → 1 (Dec) ?Name,zzt (ASCII) 0 (Null)

Name,zzt



1 0

Factory reset

Command syntax

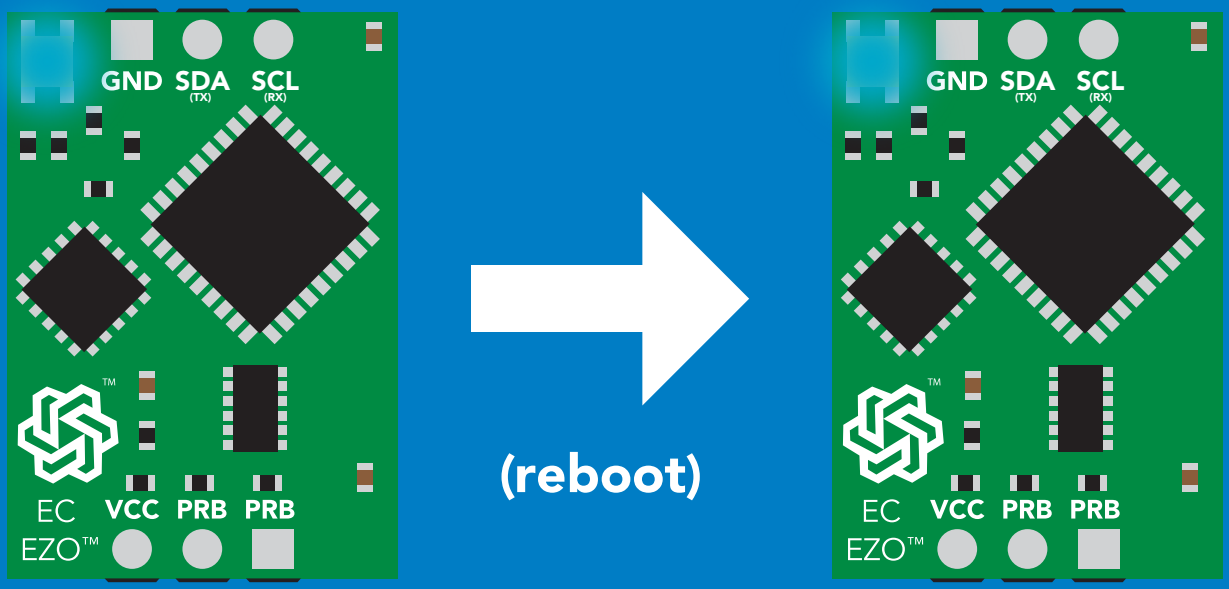
Factory reset will not take the device out of I²C mode.

Factory	enable factory reset	I²C address will not change

Example	Response
Factory	device reboot

Clears calibration
LED on
Response codes enabled

Factory



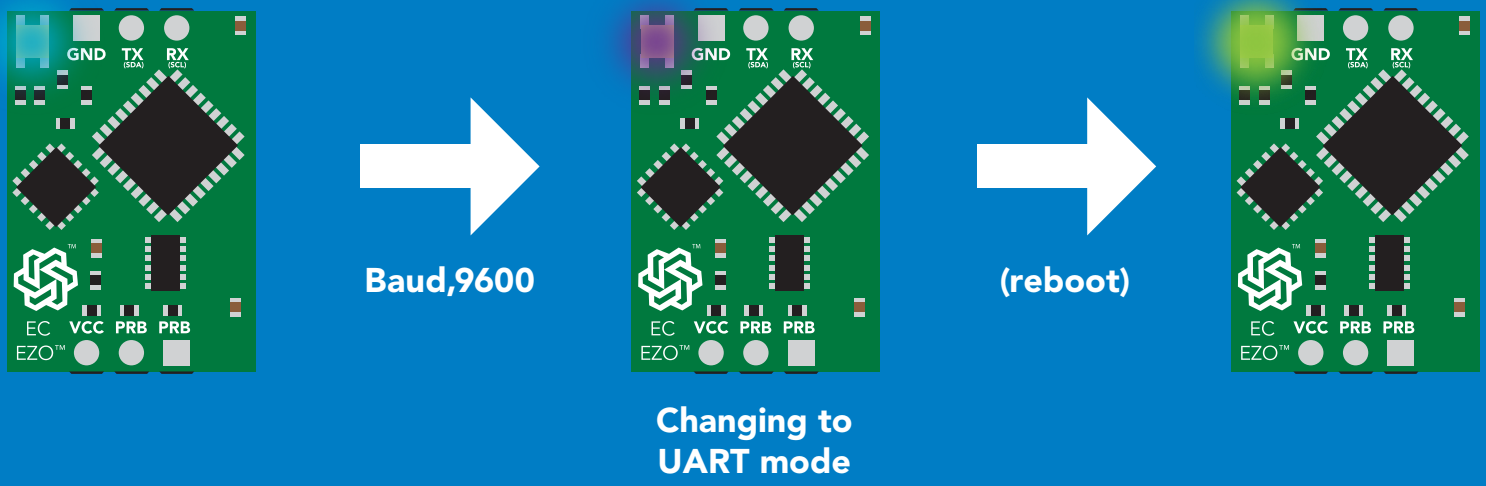
Change to UART mode

Command syntax

Baud,n switch from I²C to UART

Example	Response
Baud,9600	reboot in UART mode

n = 300, 1200, 2400, 9600, 19200, 38400, 57600, 115200



Changing to UART mode

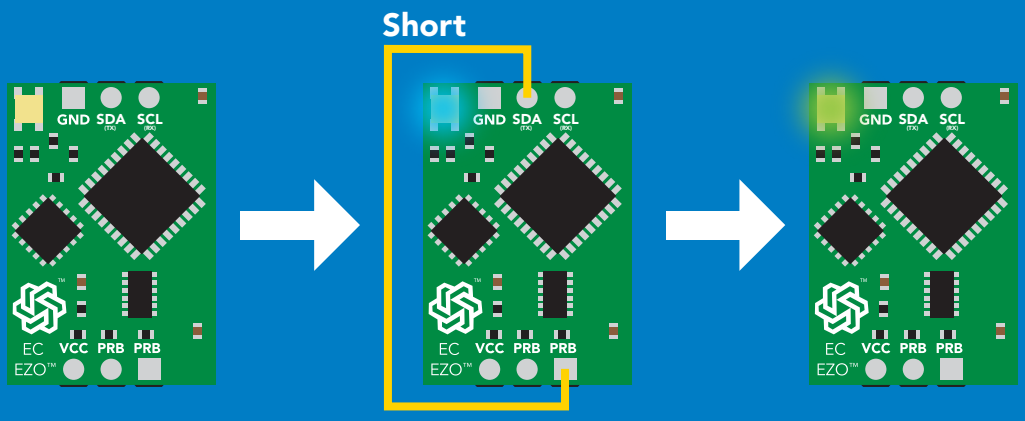
Atlas Scientific™ Environmental Robotics

r 0.1

Manual switching to UART

- Disconnect ground (power off)
- Disconnect TX and RX
- Connect TX to the right PRB
- Confirm RX is disconnected
- Connect ground (power on)
- Wait for LED to change from Blue to Green
- Disconnect ground (power off)
- Reconnect all data and power

Example



Wrong Example

Datasheet change log

Datasheet V 6.2

Added new command:
"TDS,n" Changing the TDS (ppm) conversion factor on pages 30 (UART) & 57 (I^2C).

Datasheet V 6.1

Corrected typos within the datasheet.

Datasheet V 6.0

Changed the K value range from 0.1 to 0.01 on pg 5.

Datasheet V 5.9

Moved Default state to pg 17.

Datasheet V 5.8

Revised conductivity probe range information on pg 5.

Datasheet V 5.7

Revised response for the sleep command in UART mode on pg 39.

Datasheet V 5.6

Added more information on the Export calibration and Import calibration commands.

Datasheet V 5.5

Revised calibration theory pages, added information on temperature compensation on pg. 15, moved data isolation to pg 9, and correct wiring to pg 11.

Datasheet V 5.4

Revised isolation schematic on pg. 13

Datasheet V 5.3

Added new command:
"RT,n" for Temperature compensation located on pages 30 (UART) & 55 (I^2C).
Added firmware information to Firmware update list.

Datasheet V 5.2

Revised calibration information on pages 27 & 52.

Datasheet change log

Datasheet V 5.1

Added more information about temperature compensation on pages 30 & 55.

Datasheet V 5.0

Changed "Max rate" to "Response time" on cover page.

Datasheet V 4.9

Removed note from certain commands about firmware version.
Added steps to calibration command pages 27 (UART) and 52 (I^2C).

Datasheet V 4.8

Revised definition of response codes on pg 46.

Datasheet V 4.7

Revised cover page art.

Datasheet V 4.6

Updated calibration processing delay time on pg.52.

Datasheet V 4.5

Revised Enable/disable parameters information on pages 31 & 56.

Datasheet V 4.4

Updated High point calibration info on page 11.

Datasheet V 4.3

Updated calibration info on pages 27 (UART) and 52 (I^2C).

Datasheet V 4.2

Revised Plock pages to show default value.

Datasheet V 4.1

Corrected I²C calibration delay on pg. 52.

Datasheet V 4.0

Revised entire datasheet.

Firmware updates

V1.0 – Initial release (April 17, 2014)

V1.1 – (June 2, 2014)
- Change specific gravity equation to return 1.0 when the uS reading is < 1000 (previously returned 0.0)
- Change accuracy of specific gravity from 2 decimal places to 3 decimal places
- Don't save temperature changes to EEPROM

V1.2 – (Aug 1, 2014)
- Baud rate change is now a long, purple blink

V1.5 – Baud rate change (Nov 6, 2014)
- Change default baud rate to 9600

V1.6 – I2C bug (Dec 1, 2014)
- Fixed I^2C bug where the circuit may inappropriately respond when other I2C devices are connected

V1.8 – Factory (April 14, 2015)
- Changed "X" command to "Factory"

V1.95 – Plock (March 31, 2016)
- Added protocol lock feature "Plock"

V1.96 – EEPROM (April 26, 2016)
- Fixed bug where EEPROM would get erased if the circuit lost power 900ms into startup
  This would cause the EZO circuit to revert back to UART mode if set to I2C

V2.10 – (April 12, 2017)
- Added "Find" command.
- Added "Export/import" command.
- Modified continuous mode to be able to send readings every "n" seconds.
- Default output changed from CSV string of 4 values to just conductivity; Other values must be enabled

V2.11 – (April 28, 2017)
- Fixed "Sleep"bug, where it would draw excessive current.

V2.12 – (May 9, 2017)
- Fixed bug in sleep mode, where circuit would wake up to a different I^2C address.

V2.13 – (July 16, 2018)
- Added "RT" command to Temperature compensation

V2.14 – (Nov 26, 2019)
- The K value range has been extended to 0.01

V2.15 – (June 29, 2020)
- Fixed bug where output doesnt always round to 0

Warranty

Atlas Scientific™ Warranties the EZO™ class Conductivity circuit to be free of defect during the debugging phase of device implementation, or 30 days after receiving the EZO™class Conductivity circuit (which ever comes first).

The debugging phase

The debugging phase as defined by Atlas Scientific™ is the time period when the EZO™ class Conductivity circuit is inserted into a bread board, or shield. If the EZO™ class Conductivity circuit is being debugged in a bread board, the bread board must be devoid of other components. If the EZO™ class Conductivity circuit is being connected to a micro-controller, the microcontroller must be running code that has been designed to drive the EZO™ class Conductivity circuit exclusively and output the EZO™ class Conductivity circuit data as a serial string.

It is important for the embedded systems engineer to keep in mind that the following activities will void the EZO™ class Conductivity circuit warranty:

- **Soldering any part of the EZO™ class Conductivity circuit.**
- **Running any code, that does not exclusively drive the EZO™ class Conductivity circuit and output its data in a serial string.**
- **Embedding the EZO™ class Conductivity circuit into a custom made device.**
- **Removing any potting compound.**

Reasoning behind this warranty

Because Atlas Scientific™ does not sell consumer electronics; once the device has been embedded into a custom made system, Atlas Scientific™ cannot possibly warranty the EZO™ class Conductivity circuit, against the thousands of possible variables that may cause the EZO™ class Conductivity circuit to no longer function properly.

Please keep this in mind:

1. **All Atlas Scientific™ devices have been designed to be embedded into a custom made system by you, the embedded systems engineer.**

2. **All Atlas Scientific™ devices have been designed to run indefinitely without failure in the field.**

3. **All Atlas Scientific™ devices can be soldered into place, however you do so at your own risk.**

Atlas Scientific™ is simply stating that once the device is being used in your application, Atlas Scientific™ can no longer take responsibility for the EZO™ class Conductivity circuits continued operation. This is because that would be equivalent to Atlas Scientific™ taking responsibility over the correct operation of your entire device.
